**PREEDITION**

the 1990s, the number of people in the world who are under 15 years of age is expected to increase from 1.1 billion to 1.5 billion.

As the world's population grows, the demand for food and other resources will increase. This will put pressure on the environment and on the world's food supply.

One way to meet this demand is to increase the amount of food that is produced. This can be done by using more land for agriculture, by using more water, or by using more fertilizers and pesticides.

Another way to meet this demand is to increase the efficiency of food production. This can be done by using better farming techniques, by using better seeds, or by using better irrigation systems.

There are many ways to meet the world's growing demand for food and other resources. It is up to us to decide which way is best.

One of the most important things we can do is to make sure that we are using resources wisely. This means using less land, less water, and fewer fertilizers and pesticides.

Another important thing we can do is to make sure that we are using the best farming techniques possible. This means using the best seeds and the best irrigation systems.

Finally, we can make sure that we are using the resources that we have in the most efficient way possible. This means using the resources that we have in the way that will produce the most food and other resources.

By doing these things, we can help to meet the world's growing demand for food and other resources. This will help to make sure that everyone has enough to eat and that the environment is protected.

There are many other things that we can do to help meet the world's growing demand for food and other resources. It is up to us to decide which things we want to do.
