

Code new features 'on the side' = branch

= *create a copy of the git repository to code in parallel*

You don't want the new feature/analyses you are currently implementing to ruin your existing code that works well. Creating a branch allows you to create a parallel git repository to develop your new feature on the side and eventually merge them when they have been properly tested

```
git branch name_of_the_branch      create a new branch
git switch -c name_of_the_branch    move to the new branch
```
