

Local and distant storage

= local repository (on your computer) and online repository (on GitHub)

~ local and online albums

All we have done so far is local. You created your git repo on your computer to track the different versions of your files. But what if your computer crashes? And how can you share your code? Let's make an online copy of your git repository

Your computer

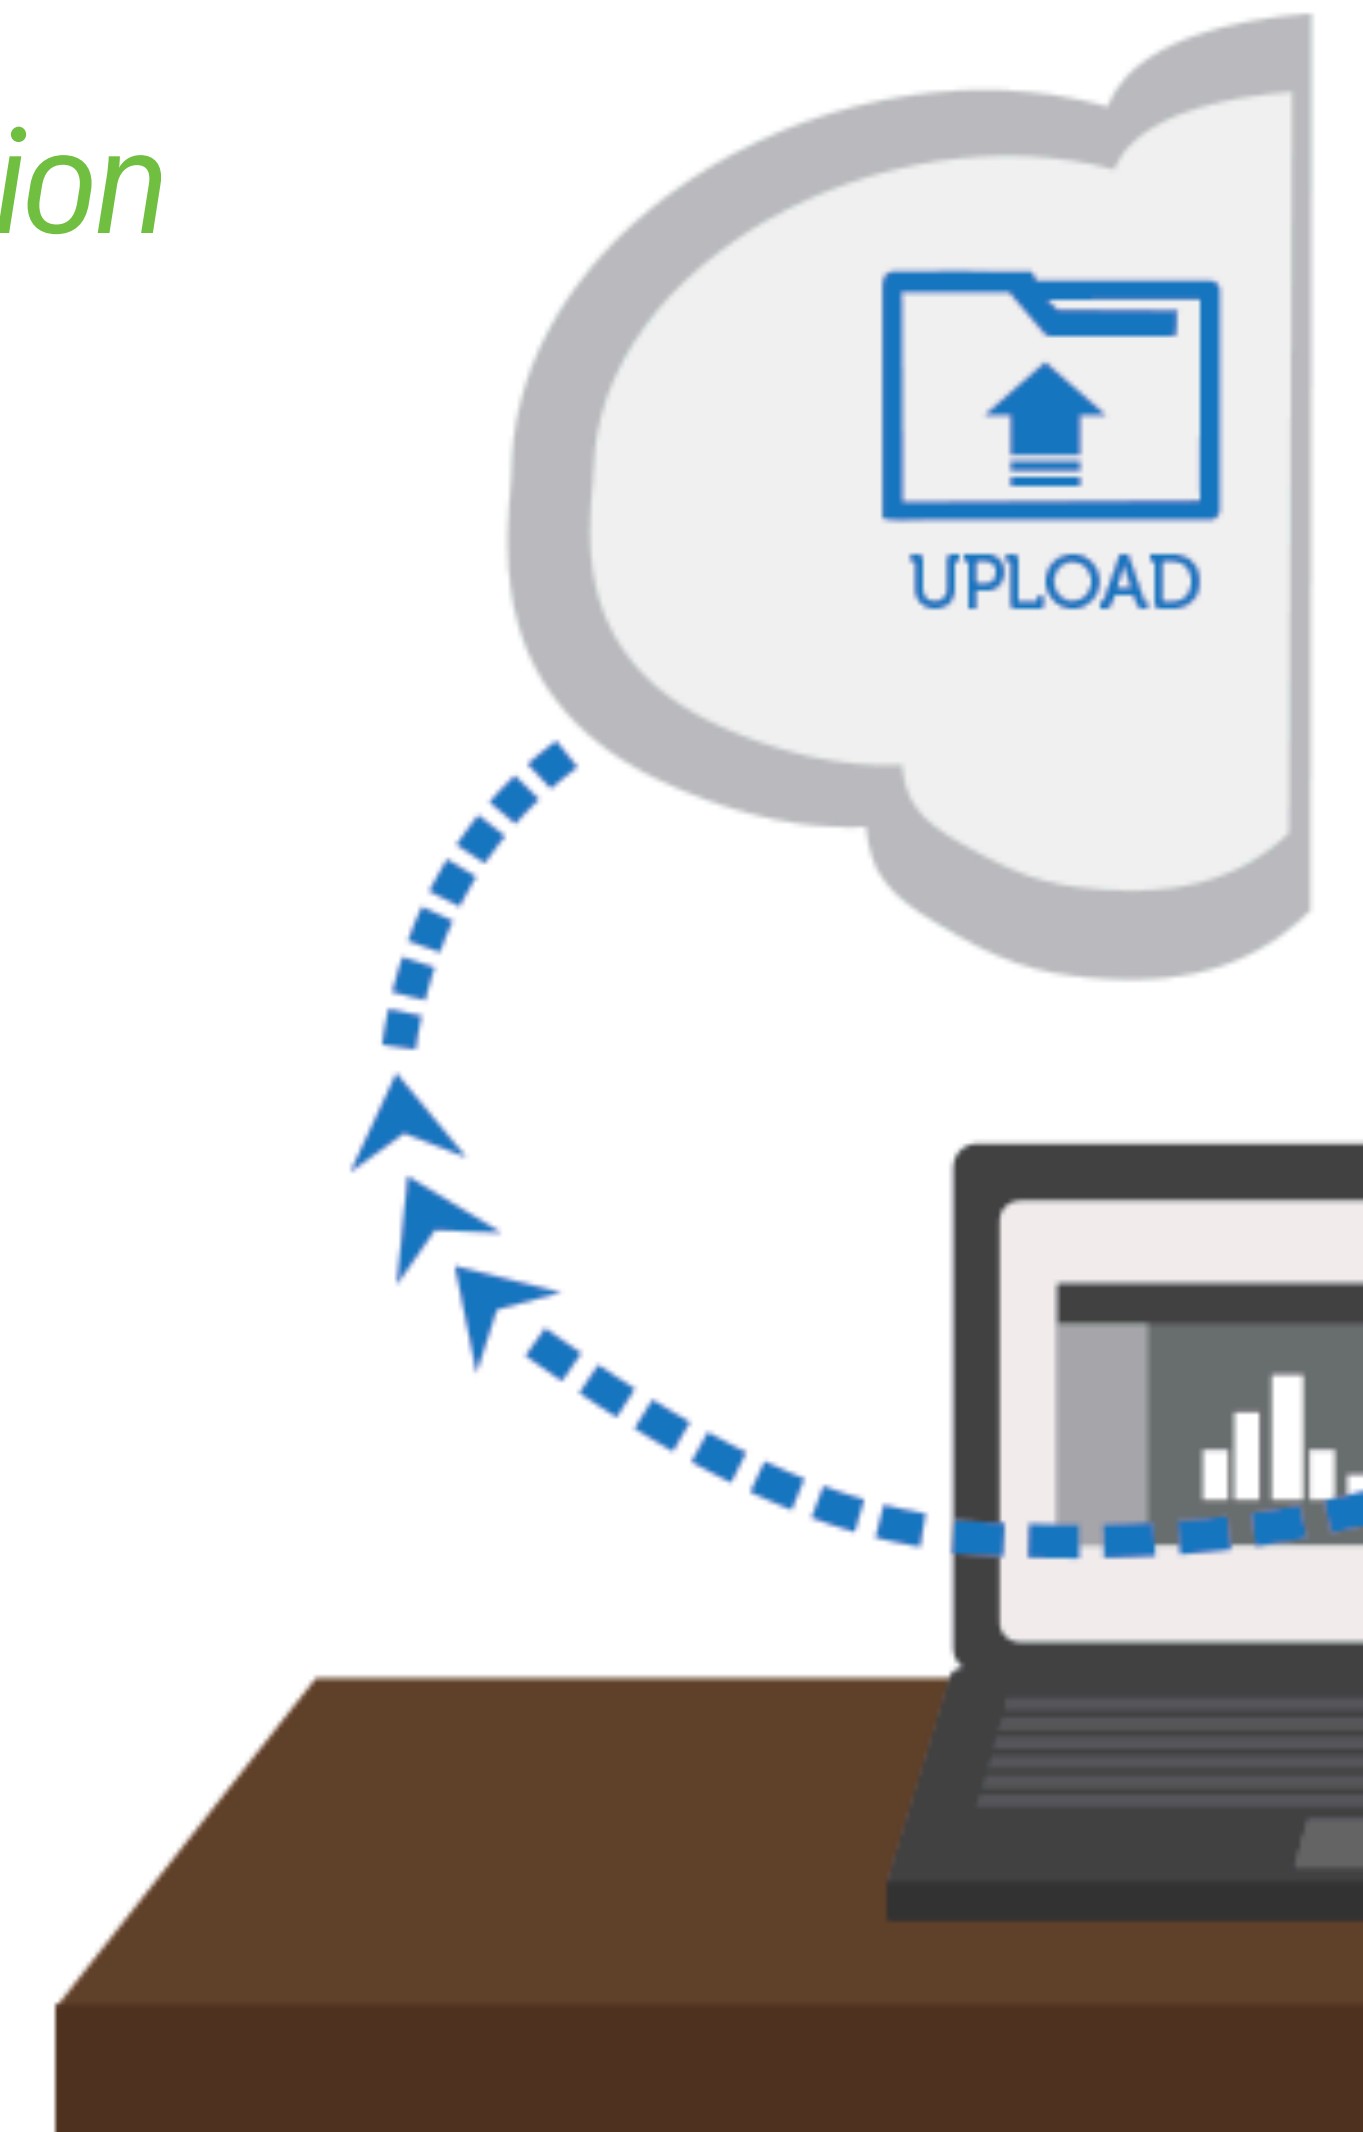

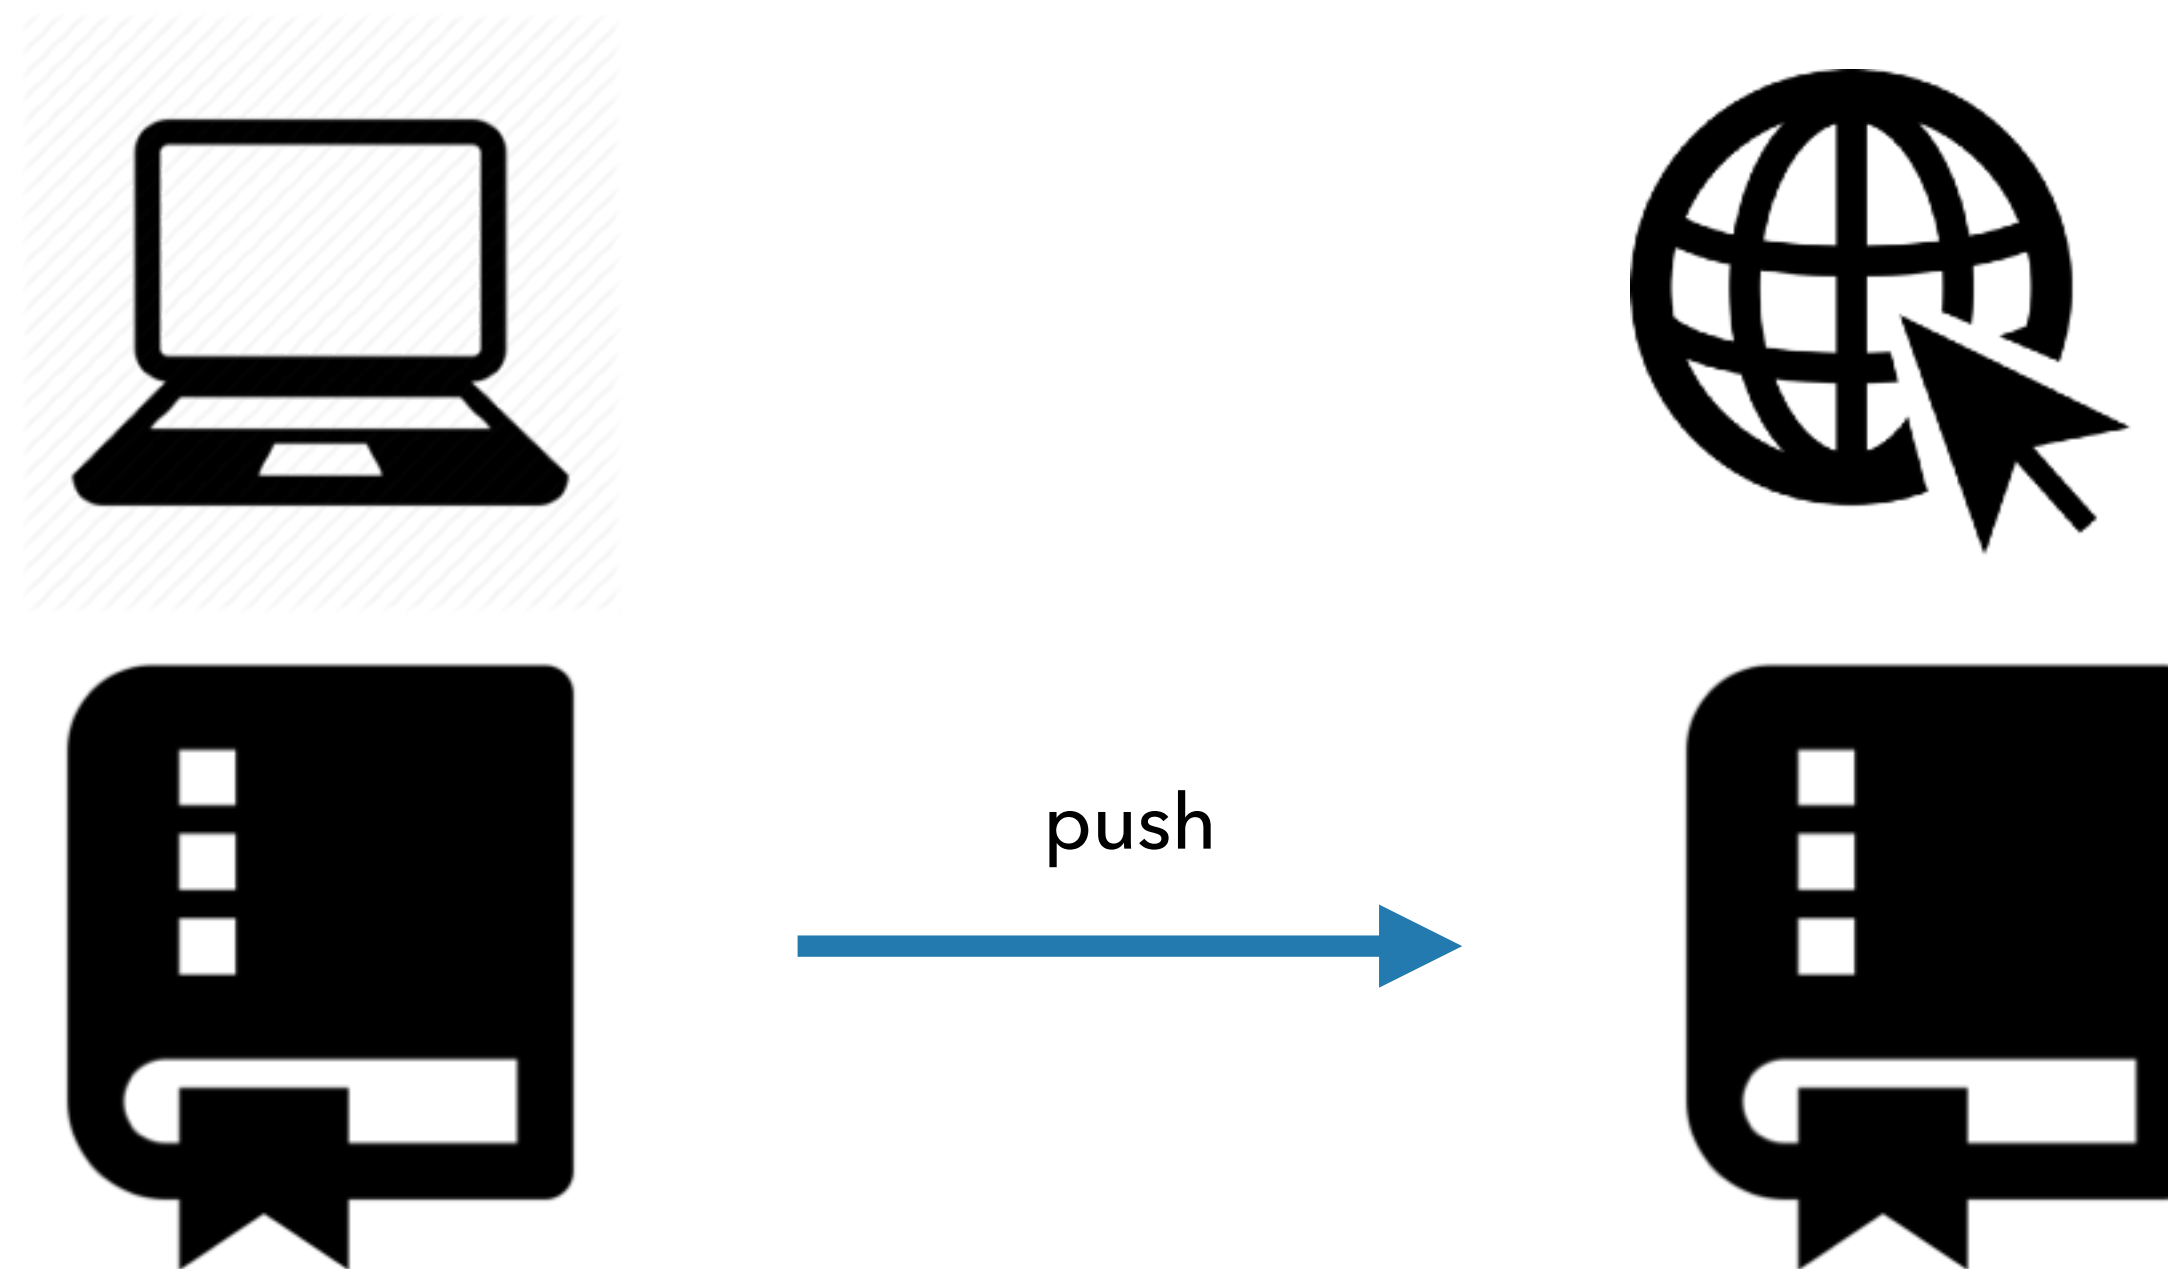

GitHub

Copy the local tracking system to its online shared version = push

= *copy the local repository to its remote version*

~ *copying the album on its online version*

`git push`
